MATÉRIEL CONCERNÉ – CONCERNED EQUIPMENT – BETROFFENES MATERIAL

ALL BUTTERFLY VALVES

STARTING OPERATIONS.

1. VALVE BODY.

1.1. General.

Open the valves completely before putting under pressure. Leave the valves open for 1 or 2 hours to allow residual impurities to get out if any.

Close the valves to check pressure tightness.

1.2. Stuffing box (if present)

After approx. 30 complete strokes and after 2 or 3 days of operation, check stuffing box tightness, the valve being open.

In case of leakage, the stuffing box must be tightened as follows:

- Close the valve and drain the downstream part.
- Unscrew the stuffing box
- Tighten the stuffing box by screwing alternatively each nut
- If the stuffing box cannot be made tight, even when screwing it up as tight as possible, the barrel has to be changed.

Important remark:

- A too tightly stuffing box prevents the plug stroke.
- After 2 or 3 days of operation, it is necessary to check the stuffing box tightness. If the valve has been working for a few weeks with a leaking stuffing box, it is most unlikely to make it leakproof just by screwing it tight, inasmuch as the packing rings have been damaged by the leakage.

1.3. <u>Temperature</u>

For valves fitted on a hot or very hot line, temperature has to be increased slowly.

2. ACTUATORS

Check that no foreign matter hinders the motion of the actuator rod and lever.
